

Software Requirements

Everything below must be installed before setting up the project. See the **Setup and Operations Guide** for step-by-step installation instructions for each item.

Software	Minimum Version	Needed For	Download
Node.js	22.x (LTS)	Running the backend and building the frontend	nodejs.org
npm	10.x	Installing project dependencies	Included with Node.js
Git	Any recent version	Getting the code, deploying updates	git-scm.com
Docker + Compose	Docker 24+, Compose v2	Running the app in production	docker.com
Code editor	Optional	Editing the code	code.visualstudio.com (or any editor)

Not required

No database server needs to be installed. The application uses SQLite, which ships as part of a Node.js package (better - sqlite3) — there is nothing separate to install, configure, or run.

Minimum machine specs

Development: any laptop from the last several years is more than sufficient. Production: a single small VPS (1 vCPU / 1GB RAM) comfortably serves 10–20 users.

Operating systems

Development works on Windows, macOS, and Linux. Production deployment (via Docker) works on any Linux server; the instructions in this documentation assume Ubuntu/Debian.
